Bluetooth HID pairing

Tera 1100L | Android and iPhone | Scan in numbered order

Before starting

Disconnect the USB cable and unplug the PC wireless dongle.
Keep the STX prefix, carriage-return terminator and desired addenda mode.

1. Scan Bluetooth HID

2. Scan Pairing

The indicator should flash blue. Pair within one minute.

3. Select the scanner on the phone

Open Bluetooth settings and choose Pair new device / available devices.

Select: BarCode Scanner HID

Success: a beep and a solid blue indicator.

If pairing expires, scan Pairing again. A double trigger press also exits pairing mode. No Enter / Exit sequence is needed for these steps.

Use HID, not SPP or BLE app mode, for keyboard-style diagnostics.

Original barcodes: Tera TR-UM018-EN-ZQ-2021.12.21-S01, printed pp. 14-15.
Print at Actual size / 100%. Keep white margins around each barcode.

Unpair / return to PC

Remove the saved pairing on the phone, then choose your next connection.

---

1. Forget the scanner on the phone

Android

Settings > Connected devices / Bluetooth > BarCode Scanner HID.

Open its settings (gear icon), then choose Forget / Unpair and confirm.

Menu names vary by phone manufacturer.

iPhone / iPad

Settings > Bluetooth > info (i) beside BarCode Scanner HID.

Choose Forget This Device and confirm.

2. To pair with another phone

Follow page 1 again on the new phone.

3. Optional: return to the PC wireless dongle

After forgetting the phone pairing, scan 2.4G Wireless below.

Plug the previously paired USB receiver into the PC and test a scan.

If needed: scan 2.4G Wireless, then Pairing (page 1), then plug in the receiver and wait for the pairing beep.

This changes the scanner connection mode; it does not erase a phone pairing.

The manual documents no dedicated unpair barcode. The Bluetooth HID On/Off setting controls the 8-second trigger shortcut, not unpairing.
A factory reset is not needed and could disturb your configured settings.
